INTRUCTIONS –

HOW TO SETUP THIS VBA FILE

Open Excel and navigate to the Developer tab.

If the Developer tab is not visible, you will need to enable it in the Excel options.

In the Developer tab, select Import and choose the file you want to import.

After importing the file, go back to the Developer tab and select Visual Basic. This will open the Visual Basic for Applications (VBA) editor.

In the VBA editor, look at the Project Explorer on the left side. Right-click on the project into which you want to insert the file, and select Insert.

Navigate to the file you want to insert and select it.

Once the file is inserted, go to the Macros dialog box (you can access this from the Developer tab in Excel or by pressing Alt + F8).

Open your .txt file.

Use Ctrl + A to select all the text in the file.

Copy the selected text (Ctrl + C).

Open Excel (preferably version 2019-2021 for optimal compatibility with the spill function).

Click on cell A1.

Paste the copied text into cell A1 (Ctrl + V).

In the Macros dialog box, find and select the CBI_BANK_STAT() macro, then click Run.

Please ensure that you have the necessary permissions and that macros are enabled in your Excel settings. If you're unsure, please consult with your IT department or a trusted advisor.
